Lab 4 - VibeCoding: Chat History (Wordle, SETAPESU26/17_wordle)

Transcript of the conversation with Claude used for this lab. Student messages are given as sent (screenshots are described in brackets). Claude's replies are condensed to the substantive content; code and long command listings are summarised, and the full code is in the repository commits.

STUDENT: [Attached: Lab_4_VibeCoding_Student_handout.pdf]
https://github.com/SETAPESU26/17_wordle follow the instructions in the pdf and do evrything and the link i sent is what i shld b working on so now do evrything fully accordingly

CLAUDE: Cloned the repo and read README.md, feedback.py, game.py, main.py, words.py. Reproduced two bugs before changing anything:
1) Duplicate letters: target 'apple', guess 'eerie' gave yellow yellow gray gray green, because the yellow check was only 'letter in target' and ignored counts.
2) Invalid guesses consumed a turn: 'continue' inside 'for _ in range(6)' still used an attempt.
Also noted words.py only had 5-letter words.

CLAUDE: Task 1 (commit 'Task 1: Fix duplicate-letter feedback'): rewrote evaluate() in feedback.py: pass 1 marks greens and counts unused target letters with collections.Counter; pass 2 gives yellows only while supply remains. Verified by hand, e.g. apple/eerie = gray gray gray gray green.

CLAUDE: Task 2 (commit 'Task 2: Win/loss handling, 6-guess limit, invalid guesses don't use a turn'): replaced the for loop with 'while len(history) < 6'; only accepted guesses are stored; added is_valid(), remaining-guesses prompt, win/loss messages, q to quit and EOF handling.

CLAUDE: Task 3 (commit 'Task 3: 4/5/6-letter modes...'): added 4- and 6-letter words (including repeated-letter words), SUPPORTED_LENGTHS, a length menu with re-prompt (or 'python main.py 6'), and unit tests. Two of my first hand-computed test expectations (pepper/pppppp and seed/eese) were wrong, not the code; I re-derived them and corrected the tests, then amended the commit so no failing tests were committed.

CLAUDE: Task 4 (commit 'Task 4: Guess history...'): numbered history table after each accepted guess (G = right spot, Y = wrong spot, - = absent), per-game summary, play-again with an in-memory session summary, and test_game.py. 20/20 unit tests passed. Packaged everything as Lab-4.zip (updated_code, original_code, before/after demo scripts, git bundle with the separate task commits, PROMPT_LOG.md, PUSH_INSTRUCTIONS.md). Explained that videos, chat export and the push must be done by the student.

STUDENT: [Screenshot: running demo_after.py from inside the zip gives 'ImportError: cannot import name WordleGame from game (...site-packages\game__init__.py)']

CLAUDE: Cause: the script was run from inside the zip, so only one file was extracted and the updated_code folder was missing; Python then picked up an unrelated installed package named 'game'. Fixed the demo scripts to load code by explicit path and to print a clear message if the folder is missing, tested with a fake shadowing package, and re-issued Lab-4.zip. Told the student to extract the whole zip first.

STUDENT: [Screenshot: demo_before.py running correctly, showing 'yellow yellow gray gray green' for eerie vs apple and five 'abc' inputs each using a turn, ending 'The word was: apple']

CLAUDE: Confirmed this is exactly the intended 'before' video: both original bugs are visible, about 8 seconds long. Told the student to record the after demo next.

STUDENT: [Screenshot: demo_after.py output] correct?

CLAUDE: Yes. Checked each line against Wordle rules with target 'apple': eerie = '- - - - G' (only the last e is green), 'abc' and the empty guess did not use a turn ([5 left] and [4 left] stayed), stone = '- - - - G', apple = 'G G G G G' solved in 3/6, history table and game summary correct. Noted the demo shows no yellow letter and suggested swapping 'stone' for 'plane' if desired.

STUDENT: bro give me some prompt log also

CLAUDE: Created Lab4_Prompt_Log.pdf: for the bug investigation and Tasks 1-4, the prompt, what changed, how it was tested, and the commit message, plus a table mapping the README's required tests to the unit tests. Clarified the prompts are cleaned-up versions of the work done and that the full exported chat is still the official deliverable.

STUDENT: fine now tel wat todo

CLAUDE: Listed the remaining steps: record the two 10-second videos, export the chat as PDF, make the personal lab repo, push the code keeping the four task commits separate, add the videos and PDFs in a final commit under Lab-4, and verify on GitHub without opening a PR to SETAPESU26.

STUDENT: [Screenshot: VS Code terminal: 'cd wordle' path not found and 'git' is not recognized as the name of a cmdlet; Source Control panel shows 23 uncommitted changes on branch main]

CLAUDE: Two problems: git was not recognised in the terminal (install Git, e.g. winget install Git.Git, then restart VS Code), and the outer Lab-4 folder was already the student's repo, so the bundle-clone route was wrong for this setup. Provided make_commits.ps1, which recreates baseline + Task 1-4 as separate commits inside the existing repo; tested the same git logic in a scratch repo (5 commits in order, 20 tests passing). Also changed the prompt log to quote commit messages instead of hashes. Told the student not to click the single Commit button.

STUDENT: [Screenshot: 'The argument .\Lab-4\make_commits.ps1 to the -File parameter does not exist']

CLAUDE: The script was not in that folder because the older zip had been extracted, which did not include it. Gave steps to check with 'dir Lab-4' and add the script.

STUDENT: [Screenshot: 'dir Lab-4' listing original_code, updated_code, the bundle, demo_after.py, demo_before.py, PROMPT_LOG.md, PUSH_INSTRUCTIONS.md] tel step by step wat to do

CLAUDE: Confirmed make_commits.ps1 was missing, attached it as a standalone download, and gave seven steps: move it into the inner Lab-4 folder, verify git and the git identity, run the script from the outer folder, add the videos and PDFs, make the final commit and push, and check GitHub.

STUDENT: step 5 where to add the video and pdf

CLAUDE: Put them in the inner Lab-4 folder (C:\Users\Sarva Sandip\Downloads\Lab-4\Lab-4\), next to updated_code and the demo scripts: before.mp4, after.mp4, chat_history.pdf and Lab4_Prompt_Log.pdf. Gave a Copy-Item command and noted GitHub's 100 MB file limit.

STUDENT: give me chathistory pdf file

CLAUDE: Generated this document.
